Anti-carcinoembryonic antigen antibody 806.077 Ab - used for diagnosis and therapy of cancer Example 11: Page 122-123; 208pp; English.

This sequence is the light chain variable region of the antibody of the invention. The antibody is an anti-CEA (carcinoembryonic antigen) antibody (806.077 Ab). Host cells or transgenic organisms transformed with DNA encoding the antibody, are used to make the antibody or administration. The conjugate is used in a medicament suitable for intravenous administration. The conjugate can be used for cancer therapy, selectively killing tumour cells. The antibody can be used for in vivo or in vitro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

PPT New humanised antibodies specific for glycated albumin - prepared by PT recombinant expression of humanised mouse antibodies, useful for, PT e.g. treating diabetic vasculopathy
Example 2; Page 15; 27pp; English.
The sequence is that of a humanised variable region of the A717 antibody light chain VL-1. The antibody has specificity for glycated albumin (GA) and is capable of neutralising the effects of GA in vivo. It can be used in the manufacture of therapeutics useful for the prophylactic treatment of complications of diabetes (especially diabetic vasculopathy and retinopathy) and atherosclerotic cardiovascular disease. The genetically engineered antibodies and may be easily prepared in pure form.

Chimeric humanised Mus musculus A717 antibody heavy chain.
Chimeric; humanised; human; murine; A717; antibody; heavy
variable region; diabetes; prophylactic treatment.
Chimeric - Mus musculus,
Chimeric - Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                           Cohen MP, Shearman CW; WPI; 98-076916/07. MPsrch_pp n on: protein - protein database search, using Smith-Waterman algorithm Tue Apr 20 14:03:38 1999; MasPar time 3.28 Seconds 125.736 Million cell updates/sec

Description: Perfect Score: Sequence: Title: >US-08-836-455-1_1 (24-34) from trans.pep (1 of 3) 63 1 MTQSPSSLSAS 11

fabular output not generated.

Scoring table:

PAM 150 Gap 11

Searched: 116695 seqs, 37453910 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

pir58 1:pir1 2:pir2 3:pir3 4:pir4

Statistics: Mean 21.222; Variance 25.990; scale 0.817

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Statistics: Mean 21.723; Variance 21.843; scale 0.994

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

MPsrch_pp n on: protein - protein database search, using Smith-Waterman algorithm Tue Apr 20 14:02:43 1999; MasPar time 4.27 Seconds 128.383 Million cell updates/sec

Description: Perfect Score: Sequence: >US-08-836-455-1_1 (24-34) from trans.pep (1 of 3) 63 1 MTQSPSSLSAS 11

abular output not generated.

Scoring table: PAM 150 Gap 11

Searched: 165420 segs, 49795644 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: sptremb16

1:sp_archea 2:sp_bacter1a 3:sp_fung1 4:sp_human 5:sp_invertebrate 6:sp_mammal 7:sp_mhc 8:sp_organelle 9:sp_phage 10:sp_plant 11:sp_rodent 12:sp_unclassified 13:sp_vertebrate 14:sp_virus

Statistics: Mean 20.775; Variance 22.138; scale 0.938

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PT against human milk fat globule disease associated tumours,
PT especially breast cancer
PS Claim 9; Page 94; 130pp; English.
CC This polypeptide sequence comprises the light chain variable region
CC (VL) of monocional anti-idiotype antibody 11D10 produced by
CC hybridoma cell line ATCC 12020. 11D10 was obtained by immunising
CC naive mice with MC-10 anti-HMFG antibody to obtain an anti-idiotype
CC response. It elicits an immune response against a specific epitope
CC of a high mol.wt. mucin of human milk fat globule (HMFG). It
CC induces an immunological response to HMFG in mice, rabbits, monkeys
CC and patients with advanced HMFG-associated tumours. Pharmaceutical
CC compositions and vaccines comprising 1D10, 1D10 polypucptides
CC and/or 11D10 polynucleotides (see also T85149-50) are claimed.
CC Also claimed are diagnostic kits and methods of using 1D10, 1D10
CC polypeptides and/or 1D10 molypucleotides, including methods of
CC treating HMFG-associated tumours. 1D10 is also used in a claimed
detect or quantify anti-HMFG antibody.
                                                                   Matches
                                                                                     Query Match

                                                                                                                                  DNA encoding retinoblastoma suppressor.protein, pRB2 - and recombinant cell lines, for the diagnosis and suppression of cells infected with adenovirus ElA. Claim 10: Page 19-22: 29pp; English.

The retinoblastoma tumour suppressor protein, pRb2, binds to the ElA transforming domain, and is useful in the diagnosis of cells infected with adeno virus ElA or a related virus. The protein may be administered as a cell growth suppressor to infected cells e.g. retinoblastoma interocular cancer cells, and may be useful for identifying other DNA tumour virus oncoproteins. Chis is the specifically claimed N-terminal amino acid sequence of the control of the nicroorganisms, or their enzymatic extracts, able invention relates to microorganisms, or their enzymatic extracts, able introgen) source. The invention also relates to new N-acetylamino-alcohol hydrolases (NAHH) from the microorganisms for preparation of chiral 1-amino-4-hydroxymethyl-2-cyclopentene from N-acyl precursors. Compared with other methods, this method of preparation involves fewer stages and does not require lithium aluminium hydride or other expensive

Iso-penicillin N synthetase activating sequences isolated from DNA from Cephalosporin acremonium and used to increase antibiotic prodn. Disclosure; pp; English.

This enzyme can be used to produce isopenicillin N from the tripeptid delta-(L-alpha-aminoadipyl)-L-cysteinyl-D-valine. Isopenicillin N is starting material for penicillin N and other cephalosporins. The greapotential use of the enzyme is to condense other tripeptides into now
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence encoding Isopenicillin N synthetase activity Iso-penicillin N synthetase; Cephalosporin acremonium; antibiotic. The protein is encoded in plasmid pPS19 and plasmid pS24. It has been used to construct novel E. coli expression vectors that drive expression of a stable, active, and novel isopenicillin-N-synthetase in E. coli. See also Q03267.
                                                                                                        N-PSDB; N60414.

New DNA encoding iso-penicillin N synthetase - for use in vectors permitting high level expression, esp. in prodn. of penicillin and cephalosporin antibacterials claim 28; page 86.7; 113pp; English.

Isopenicillin N synthetase (IPS) can be expressed using a vector which permits high level expression of TPS activity in E.coli. The IPS from E.coli forms isopenicillin N from delta-(L-alpha-aminoadipyl)-L-cysteinyl-D-valine, and is also useful for condensing other tripeptides to form new antibiotics.
                                                                                                                                                                                                                                                                                                                                                           Cephalosporin acremonium AU8656431-A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cephalosporium acremonium isopenicillin-N-synthetase. Isopenicillin-N-synthetase; enzyme.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     probetecting exposure to radiation or radio-mimetic agents - by correlation with a protein, such as transferrin receptor, present on the surface of red blood cells of a mammal psychology page 61-62; 83pp; English.

This polypeptide comprises the rat transferrin receptor (TR). Claimed methods for detecting a mammal spior exposure to radiation or radiomimetic agents (RAs) involve: isolating red blood cells from the mammal, and detecting the quantity of TRs on the red blood cells from the mammal, and detecting the quantity of TRs on the red blood cells is correlated with the mammal's prior exposure. It is possible to assess accurately cannotity of TRs on the red blood cells is correlated with the mammal's prior exposure and to directly study the effects of complative lifetime exposure and to directly study the effects of clow doses of radiation, e.g. on cancer risk and other delayed responses. The limited amount of blood necessary permits the test to be conducted as frequently as desired. The test's sensitivity, and the lethal dose ranges.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

by culture of E.coli transformants contg. expression vectors
originated from Fusarium solani M-0718.
Disclosure: Fig 9; 38pp; English.
E.coli transformed to express DAO, which catalyses the enzymatic
conversion of cephalosporin C to 7-beta-(5-carboxy-5-
oxopentanamido)cephalosporanic acid (keto-7ACA). 7ACA is an
important starting point for the production of cephem
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               R04066 stand

The limited amount of blood necessary permits the test to be conducted as frequently as desired. The test's sensitivity, extending from 0.1 cGy to over 600 cGy, spans both the environmental and the lethal dose ranges.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polypeptide and DNA encoding it - related

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
Polypeptide Tragments of CD26 - are capable of disrupting binding of CD45 and CD26 and thus interfering with T-cell activation SEXample; Pages 46-48; 73pp; ED31sh.

CC26 is a human T cell antivation antigen originally identified by its reactivity with the MAb Tal. C26 CDNA library was constructed from human PHA-activated T cells using the CDM7 vector.

Fragments of CD26 can be preped in the following manner.

CD26 Xbal-Sphi cDNA fragment is ligated to the vector RCSR-alpha-26 Xbal-Hindli DNA fragment and the linker Q46092.

The linker introduces an in-frame stop codon that results in the deletion of the segment of CD26 from AA 594 to the carboxy terminus of the wild-type protein. This deletion mutant, shown carboxy terminus given in R40917.

Claim 1; page 583-4; 12pp; japanese.
D-amino acid oxidase catalyses the oxidative deamination of D-amino acids. It is used in the sepn. of L-amino acids from racemates, in the prepn. of ketoic acid from D-amino acid, in amino acid analysis, etc. The enzyme can oxidise cephalosporin C to 7-beta-(5-carboxy-5-oxopentanamide)cephalosporanic acid, which reacts with hydrogen peroxide to give 7-beta-(4-carboxybutanamide)-cephalosporanic acid. These cpds. are important intermediates for synthesis of cephalosporin type antibiotics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence of a CD26 fragment lacking a portion of the carboxy terminal region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (ASAH ) ASAHI CHEMICAL WPI; 87-359677/51.

The sequences given in R54612-14 represents analogues of the human T cell activation antigen CD26 which have internal deletions. The analogues pref. lack residues 3-9 or 24-34. These analogues are soluble under physiological conditions and lack enough amino acid residues to render them susceptible to cleavage by signal peptidase. The peptide fragments and analogues are useful as immune or responsestimulating therapeutics, eg. they may be used for treatment of disease conditions characterised by immunosuppression, eg. AIDS or AIDS-related complex, other virally or environmentally-induced conditions, and certain congenital immune deficiencies. The peptides can be employed to increase immune function which has been impaired by use of immunosuppressive drugs, such as certain chemotherapeutic drugs.

YE YEAST ACY1-COENTRYME A:Cholesterol acy1transferase 2 (ARE2) is
C encoded by a gene (see T96370) located on chromosome X or XIV that
C was identified by homology to the human acy1-coenzyme A:cholesterol
C cy1transferase 1 gene (see T96368). ARE2 and ARE1 (see W38417)
C exhibit significant structural and functional homology to the
C putative catalytic component of cholesterol esterification in
C proteins is given in W38419. Deletion of the ARE1 and ARE2 genes
C produces a viable yeast cell with undetectable esterified sterol.
CC A claimed expression vector comprises a nucleic acid molecule
C encoding yeast wild type ARE1 or ARE2 operatively linked to a
CC promoter of RNA transcription. The vector and a claimed
C constructor system can be used for the recombinant production of
CC ARE2 inhibitors. ARE2 inhibitors can be used to treat
CC arteriosclerosis or hyperlipidaemia. ARE1 and ARE2 inhibitors can
CC also be used to inhibit fungal growth or to treat fungal invasion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁

Disclosure; Fig 5C 1-3; 121pp; English.
This protein comprises yeast acylcoenzyme A:cholesterol
acyltransferaserelated enzyme II. The invention relates to
isolated nucleic acids (see V01533-35) coding for human and mous
acylcoenzyme A:cholesterol acyltransferase II and III (see
M43406-08), also designated ACAT related gene products (ARGP) 1
and 2. These can be used to identify inhibitors useful in the
treatment of atherosclerosis and hyperlipidaemia.
Sequence 642 AA;
ARE2 inhibitors. ARE2 inhibitors ca
arteriosclerosis or hyperlipidaemia,
also be used to inhibit fungal growt
(all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Yeast acyl-coenzyme A:cholesterol acyltransferase 2. MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

abular output not generated. Tue Apr 20 14:06:10 1999; MasPar time 3.12 Seconds

Title:

Description:
Perfect Score:
Sequence: >US-08-836-455-1_1 (50-56) from trans.pep (2 of 3) 62 1 GINLHWL 7

Scoring table:

PAM 150 Gap 11

Searched: 116695 seqs, 37453910 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

pir58 1:pirl 2:pir2 3:pir3 4:pir4

Statistics: Mean 23.536; Variance 40.703; scale 0.578

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
